CERTIFICATE OF TRANSMISSION/MAILING			
I hereby certify that this correspondence is being facsimile transmitted to the USPTO or deposited with the United States Postal Service with sufficient postage as first class mail in an envelope addressed to: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450 on the date shown below:			
Signature			
Typed or printed name	Elise K. Dougherty	Date	08/07/2007

This collection of information is required by 37 CFR 1.5. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.11 and 1.14. This collection is estimated to 2 hours to complete, including gathering, preparing, and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.

If you need assistance in completing the form, call 1-800-PTO-0199 and select option 2.

Alexandria, VA 22313-1450

DECLARATION UNDER 37 C.F.R. §1.132

Sir, I hereby declare and state:

1. I am a joint inventor of the subject matter presently claimed in the above-identified patent application.
2. I received my doctorate degree in Materials Engineering from the University of Houston in Houston, TX.
3. I have been employed by IGC/SuperPower, Inc. since 1994, wherein I have been mainly engaged in research and development of superconducting materials, superconducting conductors, and processes for forming same.
4. I have reviewed the Office Action dated October 18, 2005, including the positions taken by the PTO with respect to several prior art references. I have also particularly reviewed the subject matter of US 2005/0173679, Mannhart et al. (Mannhart). For the reasons discussed below, Mannhart fails to disclose (or suggest) all features of the claimed invention.

5. The claimed invention is drawn to a superconductive article comprising a substrate tape and a superconductive layer. The superconductive layer notably includes a plurality of individually identifiable superconductive films of the same material, the films being disposed one atop another and atomically bonded to each other free of an intervening bonding layer. As described in the present specification, the films are formed by a metalorganic chemical vapor deposition (MOCVD) process, in which metalorganic precursors are reacted with each other in a deposition chamber, the reaction product forming a superconductive material that deposits on the substrate tape. As described in the present specification, pages 23+ in connection with FIGs. 1-4b, the substrate tape is translated through an MOCVD system containing multiple compartments arranged in series, each defining a deposition zone (see Zones A-E). Each zone has associated unique control parameters as described in Tables 1-5. As the substrate translates through the MOCVD system, the substrate tape experiences multiple deposition events, each deposition event corresponding to each zone, thereby forming an identifiable, discrete superconducting film. That is, by passage of the tape through a zone, the zone forms as-deposited superconductive material in the form of a film.

MOCVD deposition results in epitaxial growth of the depositing film. As such, the microstructure of the preceding film, i.e. crystal grain orientation, is continued and duplicated in the depositing film. That is, the depositing film is atomically bonded to the preceding film. More specifically, the atoms of the depositing film atomically bond to the atoms of the preceding film in well defined crystallographically defined manner as a result of the sequential MOCVD process flow. While a telltale interfacial boundary remains between films, the films are nevertheless necessarily atomically bonded to each other. These features can be clearly seen in the attached cross sectional microstructure obtained by Transmission Electron Microscopy (TEM) of a superconductive article prepared by the process disclosed in the present specification and described above. The TEM image was obtained by Dr. Terry Holesinger, a world-renowned expert, at Los Alamos National Laboratory. Dr. Holesinger followed the above-described process to unequivocally demonstrate the nature of the bonding between overlying films. The TEM microstructure clearly shows the interfacial boundaries between the films that are created between each superconductive film. However, dislocations can be seen threading through all the films indicating that the films are crystallographically oriented in the same fashion one atop each

other i.e. they have an epitaxial relationship with each other and are atomically bonded to each other.

6. In contrast, Mannhart is drawn to a process for joining separate superconductive films through physical contact or an intermediate layer, and does not disclose direct, atomic bonding with each other. In one embodiment, Mannhart discloses physically clamping two superconductors together (FIG. 5). In another, Mannhart discloses melting the intermediate layer to fuse the two adjacent superconductive layers. I acknowledge that Mannhart discloses multilayers in paragraph [0041]. However, such general suggestion does not extend to the superconductive layer as claimed, which features multiple films atomically bonded directly to each other. Adding yet additional layers to the embodiments of Mannhart remains reliant on physically bonding (clamping) or use of intermediate layers.

7. I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true, and further, that these statements were made with the knowledge that willful false statements and the like, so made, are punishable by fine or imprisonment, or both, under 18 U.S.C. 1001 and that such willful false statements may jeopardize the validity of the application or any patent issuing thereon.

Respectfully submitted,

August 6, 2007
